Glossary

Device Interface	This represents the external interface to a device.
Device Interface API	The API accepted by the device on its external interface
Device Interface Media Service API	The API accepted by the device on its external interface for Media Service
Service	The device provides the following services : DeviceAdminAgent, Media, Layout, MediaStoreAgent
Handler	The code that handles a specific API message for a given service
Agent	The Handler invokes methods on the Agent for the accepted by the device on its external interface
Engine	The Agent invokes methods on the Engine that implement the services on the device
Entity	A Source or a Destination

Introduction

This document contains the description of the device interface API for media services

Chapter 1. Media Service Overview

This chapter provides the version information and a brief description of the requests support by this service

Version

Document Version = 0.0.1
Service Version = x.x.x
Software Version = 4.0.x.x

Media Services Overview

The media service is responsible for enabling the viewing/recording/playback of media

The service provides support for relaying of media streams between endpoints

The service also provides support for lookback capabilities on live sources. The viewer can thus rewind a live source

The messages described here are in conformance with the AgentMessage described in the ref[1](API-AgentMessage.pdf)

Chapter 2. Media Services API

This chapter provides details of the Media Service API

Media Service API to be supported by a Device to start a stream

These requests are typically RPC requests received by a device capable of starting/stopping a stream

- Handling requests to start/stop streams

The request includes all the information required to start the stream

If the Start fails, the corresponding state(START_ERROR) is returned in the response

A Start/Stop of the stream results in Start/Stop Stream requests being sent to the MediaEngine

Example 2.1. StartStreamRequest payload received

```
<StartStreamRequestData>
  <streamNID>c7c002c0-43c0-451f-b087-56818bb4e88f</streamNID>
  <streamdatadoc>
    <!--
      Stream object goes here to be updated with destination IP/Port by the
      MediaAgentImpl
    -->
  </streamdatadoc>
  <mediasourcedatadoc>
    <!-- MediaSource object goes here -->
  </mediasourcedatadoc>
</StartStreamRequestData>
```

streamNID - unique identifier for the stream, will be used for future control operations on the stream

streamdatadoc - complete description of the stream (listed in appendix)

mediasourcedatadoc - complete description of the source (listed in appendix)

Example 2.2. StartStreamResponse payload sent

```
<StartStreamResponseData>
  <StreamStatus roomNID="136cc62f-6537-4cfd-b677-8d09d37738e2"
    streamNID="3bebcbb1-3ead-47b7-b006-a1c7f829b34e">
    <!-- See Appendix for StreamStatus element -->
  </StreamStatus>
</StartStreamResponseData>
```

Example 2.3. StartStreamResponse error payload sent

```
<Error code="2021">
  <Description>Media Source Busy</Description>
</Error>
```

Example 2.4. StopStreamRequest payload received

```
<StopStreamRequestData>
  <streamNID>c7c002c0-43c0-451f-b087-56818bb4e88f</streamNID>
</StopStreamRequestData>
```

streamNID - unique identifier for the stream, used at the time of start

Example 2.5. StopStreamResponse payload sent

```
<StopStreamResponseData>
  <streamNID>c7c002c0-43c0-451f-b087-56818bb4e88f</streamNID>
</StopStreamResponseData>
```

- Maintaining a state machine for each of the MediaStreams which is updated based on

The notifications received from the MediaEngine
The notifications received from the upstream relays

- The state machine action handlers are responsible for

Sending notifications to the peering destination

Example 2.6. StreamStatusEvent payload sent to the peering destination

```
<StreamStatusEventData>
  <StreamStatus roomNID="136cc62f-6537-4cfd-b677-8d09d37738e2"
    streamNID="3bebcbb1-3ead-47b7-b006-alc7f829b34e">
    <!-- See Appendix for StreamStatus element -->
  </StreamStatus>
</StreamStatusEventData>
```

Presence Events received by Devices

A Entity is a source or a destination These requests are typically received by an entity which has setup/needs to setup communications with a peer. This setup is done in the context of a "MediaRoom". The "MediaRoom" has a unique identifier referred to as roomNID. All resource allocations on the source/dest entities can be tied/linked to the presence of the MediaRoom

- Presence Event

The event includes the jid of the entity and its availability value i.e Ready or Unavailable
 If a source is notified that the dest is Unavailable it must release the resources associated with the dest
 If a dest is notified that the source is Unavailable it must update its state
 If a dest is notified that the source is Ready it must resend the StartStreamRequest(s)
 If the SC is notified that a dest is Unavailable it must mark the destination as such
 If the SC is notified that a dest is Ready it must resend the PUTCanvasRequest
 If the source/dest is notified that a MediaRoom is Unavailable it must release the resources associated with it

Example 2.7. MediaPresence Event for Source/Dest received

```
<MediaPresence type="Entity"
  roomNID="136cc62f-6537-4cfd-b677-8d09d37738e2" value="Unavailable/Ready"/>
```

Example 2.8. MediaPresence Event for MediaRoom received

```
<MediaPresence type="MediaRoom"
  jid="xpi@localhost/xpi" value="Unavailable/Ready"/>
```

type - "Entity"/"MediaRoom" indicates whether the presence is for an Entity or a MediaRoom
roomNID - The unique ID of the MediaRoom
jid - The full JID of the Entity User/Device whose presence notification is received
value - the state of the entity, could be Ready or Unavailable.

Appendix A. Data Model

The following are sample XMLs that reflect the structure of Objects involved in the MediaRoom service.

MediaRoom Objects

The MediaRoom Objects are listed below. The corresponding xml is available under the svn. The base svn URL is "https://10.51.112.47/svn/ipvsvn/model/trunk/objectXml/MediaRoom.xml" Each of the elements mentioned below is a child element in the MediaRoom document

mediasourcedatadoc : //MediaSource/data
 streamdatadoc : //Stream/data
 StreamStatus : //Stream/Status

Object Details

Explanation of the use of information in the mediasourcedatadoc and streamdatadoc for starting of streams
 Common : streamdatadoc, mediasourcedatadoc

roomNID : Common groupID for streams that are to be controlled as a group

Dest Decoder : streamdatadoc

destNID : Unique Global ID for the destination Port
 streamURL : A pre-defined streamURL configured on the source
 destUDPStartPort : Determined on the destination based on available UDP network ports
 destPortElementID : Unique Local ID for the destination Port
 sourceAgentJID : Contact for the source Port
 windowId : Reference to the window within a canvas on the destination
 canvasId : Reference to the canvas on the destination
 startWallClock : Wallclock when the request was initiated
 trackStateAtStart : State of the group/track at the time that request was initiated
 trackOffsetAtStart : Offset from the start of the group/track at the time the request was initiated

Dest Recorder : streamdatadoc

destFileParentDirNID : The unique global ID of the directory of the recording
 destFileUUID : The unique local ID of the recording file
 trimLength : The length that the PVR recording that needs to be maintained which is continuously trimmed

Source Live : streamdatadoc

relayNID : Unique global ID of the relay Port
 sourceNID : Unique global ID of the source Port
 mediaSourceNID : Unique instance ID of the mediasource on the central server
 destAgentJID : Contact for the destination Port
 resolvedSourceIP : The IP address of the source as seen by the destination
 destType : The type of the destination i.e. Stream, File, Decoder
 streamType : The type of the stream i.e. RTP, V2D, MPEGTS
 sourcePortNID : The unique global ID of the source Port on the central server
 resolvedDestIP : The IP address of the destination as seen by the source

profileXML : The xml description of the profile of the stream e.g. bandwidth, audio/video etc which is specific to the streamType

destIP : The pre-configured destination IP to be used by the source

callbackPort : The pre-configured destination Port to be used by the source

streamURLType : The type of URL requested, set to HTTP for RTP streams to point to an SDP file on the media server

trickPlay : Indicated whether the destination support playback at multiple speeds i.e. FastForward, Rewind

Source Live : mediasourcedatadoc

sourceNID : Unique global ID of the source on the central server

startOffset : The start offset of the media in case of a playback source

startTimecode : The start timecode of the media in case of a playback source

userRoomMediaSourceNID : This applies for multi-hop relays of multiple playback stream which are bring played in the same group and logically point to the same source. This enables the source to serve both users from the source input

sourceType : The type of the source i.e. Encoder, File

sourcePortNID : The unique global ID of the source Port in the central server

sourcePortElementID : The unique local ID of the source Port on the device

streamType : The type of the stream supported by the source e.g. RTP, V2D, MPEGTS

trackNID : A sub-group ID for the source

Management Server Collaboration : streamdatadoc

mediaDestNID : Unique instance ID for the media destination

profileNID : Unique global ID for the profile being used for the stream

streamOwnerUserJID : The user who initiated the setup of the stream

destStreamURL : The pre-configured streamURL for the destination

sourcePortNID : Unique global ID for the source port on the central server

mediarelayNID : Unique instance ID for the relay on the central server

xAuthAgentJID : Contact for the entity who needs to authorize access before a stream is started

streamGroups : Not used

sourceNetworkAddressRule : The NAT rule being used to resolve the IP addresses for source

destNetworkAddressRule : The NAT rule being used to resolve the IP addresses for destination

publishedSourceIP : The IP address published by the source

publishedDestIP : The IP address published by the destination

Playback, LIVE-PVR : mediasourcedatadoc

lookbackSourceNID : Unique global ID of the lookback source on the central server

lookbackSourceAgentJID : Contact for the lookback source

lookbackSourceFileUUID : Unique local ID of the lookback source file

lookbackSourceFileParentDirNID : Unique global ID of the parent directory on the central server

lookbackSourceFilePlayLength : Playlength of the lookback source file

lookbackSourceFileStartTC : Start timecode captured when the lookback source was originally recorded

StreamStatus

The StreamStatus is included in the StartResponse as well as all StreamStatus Updates

Example A.1. The StreamStatus element

```
<StreamStatus roomNID="136cc62f-6537-4cfd-b677-8d09d37738e2"
  streamNID="3bebcbb1-3ead-47b7-b006-a1c7f829b34e">
  <state>6</state>
  <URL>v2d://10.51.50.1/port=6060?bandwidth=10240000?avoption=Both?
ismulticast=false?enablekbm=false?authscheme=TOKEN?
authdata=fc654255-b350-432e-a95a-8a9c0d89c7e0
</URL>
<lastEventData>
  <!-- Last Event Data goes here -->
</lastEventData>
<relayData relayRoomNID="" relayStreamNID="" />
<MediaTimeline id="">
  <Start WC="" Offset="" TC="" />
  <Last WC="" Offset="" TC="" TimeScale="" action="" lastState=""
  requestedAction="" />
</MediaTimeline>
</StreamStatus>
```

roomNID - unique identifier for the room which includes this stream

streamNID - unique identifier for the stream

state - the state of the stream (Enumerated in appendix)

lastEventData - the last event received by the destination from the upstream source

relayData - the upstream relay roomNID and streamNID

MediaTimeline - the WallClock and Timecode at Start and at the Last update, used for PVR

Simple Examples of MediaAgent Implementation

The simplest example is one where the source can only return one URL. This MediaAgent implementation needs to implement the startStream method. An advanced source might inspect the specifications of the stream to decide on how to configure the source and then return the URL. In this case however the source is very simple and can stream at a fixed profile. An example of a profile parameter is the bandwidth to stream at.

```
public Document startStream(DeviceI device, String requestNID,
  String streamNID, Document streamDataDoc,
  Document mediaSourceDataDoc) throws Exception {
  String streamStatusXML = FilePATH.readFile(FilePATH.streamStatusPath);
  Document streamStatusDoc = XMLUtils.stringToDocument(streamStatusXML);
  XMLUtils.setValueXPath(streamStatusDoc, "//state", String.valueOf(MediaAgentI.WA
  XMLUtils.setValueXPath(streamStatusDoc, "//URL",
    "v2d://10.51.50.1/port=6060?bandwidth=10240000?avoption=Both?ismulticast=false?
  return streamStatusDoc;
}
```

Sample Start Request

This is a sample start request. An encoder needs to look at a simple subset. Most of the remaining elements are related to PVR/Relay functionality. All the elements of the `streamdatadoc` and `mediasourcedatadoc` have been explained in the previous section.

Example A.2. The Start Request

```
<?xml version="1.0" encoding="UTF-8"?>
<message id="B9xmI-5218" to="tx1@localhost/tx1"
  from="0c31592d-fbf0-49ae-a7ea-e9e87c7046b1@conference.localhost/managementserver@"
  type="groupchat">
  <x>
    <AgentMessage from='xpi@localhost/xpi' to='xpi@localhost/xpi' type='Request' log
    <Request>
      <header>
        <servicename>Media</servicename>
        <requestname>StartStreamRequest</requestname>
        <userJID>none</userJID>
        <requestNID>none</requestNID>
        <clientdata>none</clientdata>
      </header>
      <data>
        <StartStreamRequestData>
          <streamNID>c7c002c0-43c0-451f-b087-56818bb4e88f</streamNID>
          <streamdatadoc .../>
          <mediasourcedatadoc .../>
        </StartStreamRequestData>
      </data>
    </Request>
  </AgentMessage>
  </x>
</message>
```

```
